Idea/Approach Details

Describe your idea/Solution/Prototype here:

- Managing cases, like legal and illegal matters or other issues can be really hard. People often lose important information and things in their life.
- So, we have created a website where you could easily find a way to solve your problem. In this site you can select the category(under which our problem comes) and search for suitable advocate(experienced) based on your issue along with their name, address and their contact details, which reduce our searching work and saves time.

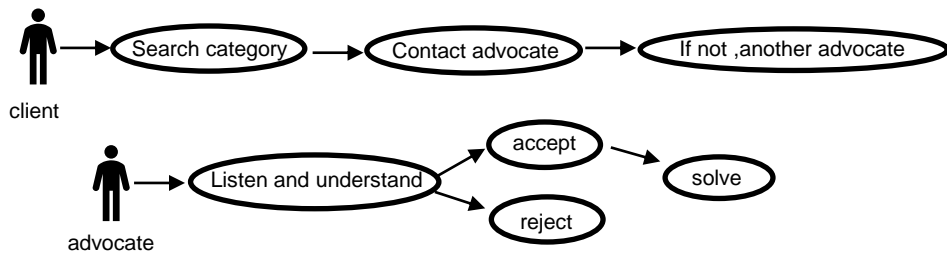

Describe your Technology stack here:

- Technology stack in the context of case management, we have considered:
- Frontend Framework: It is the part that user interact with the user interface.
- Languages:
- **HTML** : (Hyper text markup language) for development of web page.
- **CSS** : To define **styles** for web pages.
- **JAVASCRIPT**: Allows to add dynamic behavior.

Idea/Approach Details

Describe your Use Cases here

- **Client:** He/ She will select the category and also their issue and then contact to their advocate, if he's not available/ accept then client will go for another advocate.
- **Advocate:** After listening and understanding he may accept/reject the case. If he accepts then case will be solved otherwise same as go for the other advocate.

Describe your Dependencies / Show stopper here

- The web page that we have created has been checked and the major dependency is frontend.
- Therefore, the major show stopper would be backend so, that user can't be able to file the case here.
- Once, we are perfect with backend ,user can able to file the case and if possible we want to arrange the live meeting between client and advocate , it helps a lot to discuss about issue.
